Overview

Architectural and regulatory information systems are modeled in LeanIX across all TOGAF architecture levels. This is achieved through the creation, maintenance, and assignment of architectural objects.

Architecture Levels

Architecture Vision

At this level, strategy and transformation are represented through:

- **Objectives**
- **Initiatives (Projects)**

Business Architecture

This layer includes the following objects:

- **Organization**
- **Business Capability**
- **Process**

  Note: Except for *Business Capabilities* and their mappings, these elements are created and maintained outside of LeanIX as part of business process modeling.

Information Systems Architecture

This central layer maps the implementation of business capabilities. It includes:

- **Digital Solution**
- **IT Product** (Application, Platform, Group Application)
- **Interface**

These are part of the **Application Architecture**. Additionally:

- **Data Objects** are managed in the **Information Architecture** layer.

Together, the **Business Architecture** and **Information Systems Architecture** form the **Business Architecture** domain.

Technology Architecture

This layer supports the technical realization of applications. Applications from the Application Architecture require infrastructure for procurement, integration, and operation. Relevant objects include:

- **IT Product (Platform)**
- **IT Component**
- **Vendor**
- **Tech Capability**

LLM-Ready Structure Summary

Image Description: TOGAF-Based Architecture Metamodel (LeanIX)

General Overview

The image is a structured diagram representing a metamodel of an information system architecture based on the TOGAF® framework. It is visually divided into four architecture layers, each containing specific object types. The model aligns with LeanIX terminology and structure.

Architecture Vision (TOGAF® A)

- **Objective** (Color: Pink)
- **Initiative** (Color: Purple)

  Represents strategic goals and transformation initiatives.

Business Architecture (TOGAF® B)

- **Organization** (Color: Black)
- **Business Capability** (Color: Grey)
- **Process** (Color: Green)

Captures the business structure, capabilities, and operational processes.

Information Systems Architecture (TOGAF® C)

Application Architecture

- **Digital Solution** (Color: Red)
- **IT Product** (Color: Dark Red)
- **Interface** (Color: Yellow)

Information/Data Architecture

- **Information Object** (Color: Purple)

  Represents the implementation of business capabilities through applications and data structures.

Technology Architecture (TOGAF® D)

- **IT Component** (Color: Dark Blue)
- **Vendor** (Color: Teal)
- **Tech Capability** (Color: Light Green)

  Describes the technical infrastructure and supporting technology components.

Architectural Objects and Attributes

Each object in LeanIX is represented by a dedicated Fact Sheet. These are interconnected through mappings to form a comprehensive, domain-oriented, and technical architecture.

The attributes of each object are based on the LeanIX standard data model and are extended with Porsche-specific attributes, especially in the areas of:

- Security
- Data Protection
- Governance

Each Fact Sheet type includes mandatory fields required to meet PASS minimum standards. These fields are clearly marked.

Page Structure and Navigation

To ensure consistency and readability, all pages follow the same structure and provide context-specific content.

Main Page

Each architectural object is described in the following sections:

- **Definition**: Explains what the object represents, based on standard definitions and Porsche-specific characteristics.
- **Purpose and Benefit**: Describes the role and value of the object in architecture modeling.

Attributes Subpage

Details the attributes of the object, aligned with the corresponding Fact Sheet.

Modeling Subpage

Explains how the object should be modeled, where modeling takes place, and which roles are responsible. It includes Porsche-specific modeling guidelines and links to LeanIX standard modeling practices.

> Recommendation: Follow LeanIX standard guidelines unless Porsche-specific deviations apply.

New Attributes for Future Requirements

New attributes can be added with sufficient justification, focusing on architecture-relevant aspects. Suggestions can be submitted at any time via a feature request.

Structure Summary

Context

- **Domain**: Enterprise Architecture
- **Tool**: LeanIX
- **Framework**: TOGAF
- **Organization**: Porsche AG (PAG)
- **User Roles**: Enterprise Architect, Business Analyst, Business Unit Staff

---

Architecture Levels and Objects

TOGAF Layer	LeanIX Objects	Notes
Architecture Vision	Objectives, Initiatives (Projects)	Represents strategy and transformation
Business Architecture	Organization, Business Capability, Process	Process and Organization modeled outside LeanIX
Information Systems Architecture	Digital Solution, IT Product (Application, Platform, Group Application), Interface	Represents implementation of business capabilities
Information Architecture	Data Object	Managed separately from Application Architecture
Technology Architecture	IT Product (Platform), IT Component, Vendor, Tech Capability	Supports infrastructure and technical realization

---

Object Modeling in LeanIX

- **Fact Sheets**: Each object is represented by a Fact Sheet.
- **Mappings**: Objects are linked via mappings to form a domain-oriented and technical architecture.
- **Attributes**:
  - Based on LeanIX standard data model
  - Extended with Porsche-specific attributes (e.g., security, data protection, governance)
  - Mandatory fields defined by PASS minimum standards

Documentation Structure

Page Type	Content
Main Page	Definition, Purpose and Benefit
Attributes Page	Detailed list of attributes per object
Modeling Page	Modeling logic, responsibilities, Porsche-specific guidelines, LeanIX links

---

Governance and Change Management

- **New Attributes**:
  - Can be added with justification
  - Must be architecture-relevant
  - Submitted via feature request process
