Introduction

This page describes the **modeling guidelines for Digital Solutions** in the context of enterprise architecture at Porsche. It is based on the general modeling guidelines of PAG and includes specific instructions for creating and maintaining Digital Solution fact sheets in LeanIX. The creation and editing of a Digital Solution fact sheet follows the standard procedure for creating a general fact sheet as described in "How to create a fact sheet".

General Modeling Rules

Lifecycle Management in LeanIX Fact Sheets

Each **Fact Sheet type** in LeanIX can be assigned a **lifecycle**. Whether this assignment is **mandatory** depends on the specific Fact Sheet type and is indicated on its detail page.

Recommended Practice

Regardless of whether the lifecycle is mandatory, it is **strongly recommended** to provide the following information:

- **Start of productive use** (Go-Live date)
- **Decommissioning date** (if known)

Depending on the desired level of detail, additional lifecycle milestones can also be modeled (e.g., development start, pilot phase, sunset planning).

Benefits

Accurate lifecycle data supports:

- **Strategic planning** and **portfolio management**
- **Compliance** with regulatory and audit requirements
- **Impact analysis** for changes and decommissioning
- **Architecture governance** across all layers

Organizational Responsibilities

Each Fact Sheet in LeanIX must include an assignment of **organizational responsibility**. This responsibility can be defined at two levels:

- **Organizational Structure Level** (e.g., departments, business units)
- **Process Organization Level** (e.g., Agile Release Trains, portfolios)

For certain Fact Sheet types, a distinction may also be made between **functional (business) responsibility** and **technical (IT) responsibility**.

> At least one form of responsibility must be specified—either at the organizational structure level or the process organization level.
> Ideally, both levels should be documented to ensure full traceability and accountability.
>
> **If IT responsibility is defined as mandatory in the modeling guidelines for a specific Fact Sheet type, it must be provided without exception.**

Responsibility at the Organizational Structure Level

At Porsche, the **organizational structure** is defined by the official organizational chart, which organizes the company into hierarchical levels such as:

- Division
- Main Department
- Department
- Subdepartment (lowest level)

> In LeanIX modeling, unless explicitly stated otherwise, responsibility must always be assigned to the **lowest available level** of the organizational structure.

Key Principles

- Always reference the **most granular organizational unit** available.
- Ensure that the assigned unit reflects the **actual operational responsibility**.
- This ensures **clear accountability**, **accurate reporting**, and **effective governance**.

Responsibility at the Process Organization Level

Many IT products and applications at Porsche are developed and operated by **Agile Release Trains (ARTs)**. Others are managed within specific **portfolios**.

Assignment Guidelines

- If an **ART** is responsible for a product (or any other relevant Fact Sheet type), this responsibility must be **explicitly documented** in LeanIX by assigning the corresponding ART Fact Sheet.
- If the responsibility lies with a **single portfolio**—as is often the case with **P51 applications**—then assigning the portfolio is **sufficient**.

  ✅ Always ensure that the assigned ART or portfolio accurately reflects the **operational ownership** of the product.

Key Principles

- Use the **ART Fact Sheet** when agile teams are responsible for development and operations.
- Use the **Portfolio Fact Sheet** when responsibility is anchored in a business or IT portfolio.
- This ensures **clear accountability**, supports **agile governance**, and aligns with **LeanIX modeling standards**.

Please note

Only organizational fact sheets that are tagged with "**Synced**" or "**Manual**" may be used! The use of fact sheets with the tag "**Legacy**" is not allowed!

Specific Modelling Rules and Best Practices for a Digital Solution

Purpose and Applicability

The modeling of a **Digital Solution** is only required when it has been explicitly identified through a **Value Stream Identification Workshop** as part of an **Agile Release Train (ART) ramp-up**.

> Modeling outside of this SAFe context is not permitted and must be avoided.

If you have technical or architectural questions regarding Digital Solutions, please consult the responsible **ART Product Team** or the **Enterprise Architect** assigned to the ART.

Modeling Guidelines

A Digital Solution must follow the naming convention defined by the ART that owns it. This ensures consistency and traceability across the portfolio.

Each Digital Solution must include at least one assigned **IT Product**. These IT Products represent the technical building blocks that deliver business functionality and are developed and maintained by agile teams within the ART.

To complete the modeling of a Digital Solution, the responsible **ART** must be explicitly assigned. Optionally, a unit from the organizational structure (e.g., a department or business unit) can also be linked to the solution.

Additionally, it is possible—but not mandatory—to link the Digital Solution to relevant **initiatives**, **business capabilities**, and **consuming organizational or processual units**. These optional associations can enhance traceability and strategic alignment but are not required for the core modeling process.

Summary

This modeling approach ensures that Digital Solutions are only created when they are strategically relevant, aligned with value streams, and embedded within the SAFe delivery structure. It supports architectural governance, portfolio transparency, and the consistent evolution of business-enabling technology.

Summary: Digital Solution Modeling Guidelines (Porsche, SAFe Context)

Section	Element	Description
1. Context	Framework	Enterprise Architecture at Porsche, based on SAFe and PAG modeling standards
	Tooling	LeanIX used for creating and maintaining Digital Solution fact sheets
	Reference	General fact sheet creation process described in “How to create a fact sheet”
2. Applicability	Modeling Requirement	Only required if the Digital Solution is identified via Value Stream Identification during ART ramp-up
	Outside Scope	Modeling outside the SAFe organization is not allowed
	Contact Roles	ART Product Team and Enterprise Architect are responsible for guidance
3. Modeling Rules	Naming Convention	Must follow the naming defined by the owning ART
	IT Product Assignment	At least one IT Product must be assigned to each Digital Solution
	ART Assignment	Responsible ART must be explicitly assigned
	Org Unit Assignment	Optional: organizational unit (e.g., department) can be linked
	Optional Linkages	May include initiatives, business capabilities, consuming org/process units
4. Purpose	Strategic Relevance	Ensures Digital Solutions are only modeled when strategically aligned
	Value Stream Alignment	Embeds Digital Solutions in SAFe delivery structure
	Governance Support	Enables architectural governance and portfolio transparency
	Technology Enablement	Supports consistent evolution of business-enabling technology

Metamodel View

The diagram shows the possible relations between the entities that can be used to model a business capability in the context of the appropriate architecture level.

Structure Summary

Image Title: *Metamodel View – Digital Solution*

Type: Conceptual Metamodel Diagram

Purpose: To illustrate the structural and semantic relationships between key architectural elements involved in defining a Digital Solution within an enterprise architecture framework, aligned with SAFe and TOGAF®.

Structural Overview

The diagram is divided into two main sections, each enclosed in a **yellow frame**:

Upper Section

- Contains a **pink rectangle** labeled **"Initiative"**
- Connected via a labeled line **"affected"** to the **Digital Solution** in the lower section

Lower Section

- Central element: **Green rectangle** labeled **"Digital Solution"**
- Connected to three pink rectangles:
  - **"IT Product"** (connected via **"consists of"**)
  - **"Business Capability"** (connected via **"affected"**)
  - **"Organization"** (connected via **"Responsible / Consumes"**)

Right Side

- Two **yellow circles** representing TOGAF® phases:
  - **TOGAF® A. Architecture Vision**
  - **TOGAF® B. Business Architecture**

Footer

- Caption: **"Metamodel View Digital Solution"**

Semantic Relationships Captured

- **Initiative → Digital Solution**: Indicates that a business initiative affects or drives the creation of a digital solution.
- **Digital Solution → IT Product**: A digital solution is composed of one or more IT products.
- **Digital Solution → Business Capability**: The solution impacts or enables specific business capabilities.
- **Digital Solution → Organization**: Organizational units are responsible for or consume the digital solution.
- **TOGAF® Alignment**: The model is contextualized within TOGAF® phases A and B, linking strategic vision to business architecture.

Modeling Intent

This metamodel provides a structured view of how digital solutions are defined and contextualized within enterprise architecture. It supports traceability from strategic initiatives to technical implementation and organizational responsibility, facilitating alignment between SAFe delivery structures and TOGAF® architectural principles.
